Illustrative — For Discussion

CCIR GPU Credit Framework

Illustrative Applications of CRI-8G Rates in Credit Structures | v1.0

Hypothetical Borrower	Hypothetical GPU Operator LLC — $50M Senior Secured Revolving
Collateral	125 × 8-GPU SXM Nodes (1,000 GPUs) — H100, B200, H200
Term	36 months · Monthly borrowing base certificate; quarterly financial covenants
Reference Rate	CRI-8G Benchmark Series · computecreditindex.com
Applications	Three covenants (§7.01–§7.03) · Revenue Coverage, Collateral Coverage, Contract Renewal Risk
Status	Illustrative. All parameters set by counsel and lenders.

CCIR does not participate in or structure credit transactions referencing CRI rates, and does not provide advice regarding any such transaction. This document illustrates how CRI-8G reference rates may be referenced in GPU-backed credit structures. All borrower details, rates, trigger levels, and covenant structures are hypothetical, illustrative, and entirely non-prescriptive. All parameters, thresholds, and formula inputs shown are examples only — they are credit judgments determined by counsel and lenders, not by CCIR. CCIR is a reference rate provider. This is not legal advice.

1. The CRI-8G Rate — On-Demand Asking Rate

Each rate in the CRI-8G Benchmark Series is the 7-day trailing median of publicly listed, noninterruptible on-demand asking rates for 8-GPU SXM InfiniBand node configurations, collected daily from CCIR's qualifying provider universe. A separate rate is published for each GPU model (CRI-H100-8G, CRI-B200-8G, CRI-H200-8G, etc.). The rate is expressed in $/GPU/hr.

Five properties make this rate construction appropriate for credit document citation:

Objective. The rate is derived from publicly posted prices — not negotiated transactions, survey responses, or expert judgment. No human discretion enters the calculation. The asking rate is what a provider publishes to all buyers, not what a particular buyer negotiated in a private transaction.

Reproducible. Any counterparty can independently verify a published CRI-8G rate by collecting the same source data and applying the published methodology. The flat median of observable asking rates across a defined provider universe is a calculation any party can replicate — in a workout, at a transfer, or in a dispute.

Resistant to manipulation. Publicly listed asking rates are posted to attract buyers, not to influence a benchmark. No single provider can move the median without changing the price it offers to its entire customer base. The 7-day trailing median dampens transient price movements and reduces sensitivity to short-term listing volatility while preserving responsiveness to sustained market shifts.

Consistent and observable. On-demand asking rates are published continuously by GPU cloud providers — they are the most consistently available pricing signal in the compute market. Unlike executed transaction data (which is sparse, private, and subject to volume-dependent discounts), asking rates are visible to all market participants at all times.

Reflects the deployment economics of the collateral. The 8-GPU SXM node is the standard deployment unit for training and high-performance inference workloads. Noninterruptible capacity — committed, non-preemptible access — is the pricing tier that reflects how the collateral actually

© 2026 Compute Credit Index Research LLC · research@ccir.io · ccir.io

generates revenue when deployed. Interruptible or spot pricing reflects a discount for preemption risk that does not apply to a borrower operating committed infrastructure for contracted customers.

2. Three-Covenant Framework

Ref.	Application	How CRI-8G Is Used	Parameters Set By Counsel / Lenders
§7.01	Revenue Coverage	Actual GPU revenue vs. CRI-implied market revenue — ensures contracted operations outperform the on-demand market floor	Minimum coverage ratio (1.05× is illustrative), Test Period, fallback provisions
§7.02	Collateral Coverage / LTV	Marks pledged GPU fleet to CRI-8G per model using cap rate formula — not book depreciation or contracted revenue	Capitalization Rate, Utilization Assumption, LTV cap, Advance Rate, deficiency cure period
§7.03	Contract Renewal Risk	Per-model Contract Premium Ratio: Base Contracted Rate ÷ CRI-8G — two-sided surveillance over rolling forward window	Premium Schedule deductions (fixed at closing), Convergence Notice threshold, Reset Cliff threshold and Forward Renewal Exposure gate

Key asymmetry. A declining CRI-8G rate tightens §7.02 Collateral Coverage (the hardware backstop marks down) while §7.03 Contract Renewal Risk widens the spread (locked contracts hold above a falling market floor) and §7.01 Revenue Coverage improves (actual revenue further above a falling CRI-implied floor). These covenants move in different directions during an on-demand market decline. The inflection comes at contract renewal.

3. Illustrative Scenario Analysis

Assumed starting position: contracted revenue above market at closing; borrowing base comfortably covered. All threshold levels are illustrative — the behavioral logic is what matters, not the specific numbers.

Scenario	§7.01 Revenue Coverage	§7.02 Collateral Coverage	§7.03 Contract Renewal Risk
Baseline	PASS 1.10× — contracted revenue above on-demand floor	PASS LTV 42.7% — well below 80% cap	PASS CPR 1.14–1.18× per model — above 1.10 threshold
Rate compression CRI-8G falls 25%	IMPROVING Coverage widens as CRI-implied falls; locked contracts hold	WATCH BB $45.7M; $5.7M cushion	WIDENING CPR increases — locked contracts above falling market
Rate compression CRI-8G falls 35%	PASS Contracted revenue still above implied market	NEAR-BREACH BB $39.6M vs $40.0M outstanding	WATCH High CPR — monitor Forward Renewal Exposure for Reset Cliff
Contract expiry + rate decline	BREACH Renewed contracts re-price at or below CRI-implied floor	BREACH Revenue no longer supports collateral mark	BREACH Reset Cliff — material volume re-pricing into lower market

Locked contracts decouple revenue coverage from on-demand rate movements — until they expire. A falling CRI-8G rate tightens §7.02 (hardware marks down) while §7.01 and §7.03 widen the

spread (locked contracts hold). The inflection comes at contract renewal, when expiring contracts re-price into the current market.

4. §7.01 — Revenue Coverage Test

A contracted-revenue borrower should be earning above the on-demand asking rate — that premium is the primary credit support. The CRI-8G rate represents the median asking rate for uncommitted, on-demand 8-GPU node capacity. A borrower whose actual revenue falls below 1.05× this floor is either re-pricing renewals below market, carrying excess idle inventory, or experiencing demand erosion in its contract book.

6.1 Illustrative Covenant Language

SECTION 7.01 — REVENUE COVERAGE TEST — Financial Covenant

Borrower shall not permit the Revenue Coverage Ratio, as of the last day of any Test Period, to be less than 1.05 to 1.00. [1.05× is illustrative — threshold is a credit judgment set at underwriting.]

"Revenue Coverage Ratio" means, for any Test Period, the ratio of (a) Actual GPU Revenue for such Test Period to (b) CRI-Implied Market Revenue for such Test Period.

"CRI-Implied Market Revenue" means, for any Test Period, the sum for each Eligible GPU Model of (i) the CRI 8-GPU Node Rate for such model as of the last day of such Test Period, multiplied by (ii) 8, multiplied by (iii) 730, multiplied by (iv) the number of Active 8-GPU Nodes of such model during such Test Period.

Each Compliance Certificate shall set forth: (a) Actual GPU Revenue, (b) CRI-Implied Market Revenue, (c) the Revenue Coverage Ratio, and (d) for each Eligible GPU Model, the per-model Effective Utilization Rate (Actual GPU Revenue attributable to such model ÷ CRI-Implied Market Revenue for such model).

If a CRI 8-GPU Node Rate is not published for any model on the last day of a Test Period, the most recently published rate within the prior 5 Business Days shall be used. If no publication is available within such period, the fallback provisions set forth in the credit agreement shall apply.

6.2 Worked Example

	H100 SXM	B200 SXM	H200 SXM	Total
Active 8-GPU Nodes	60	40	25	125
CRI-8G Rate ($/GPU/hr)	$3.25	$5.75	$3.80	—
CRI-Implied Monthly Revenue (A)	**$1,138,800**	**$1,343,200**	**$554,800**	**$3,036,800**
Actual Monthly Revenue (B)	**$1,218,691**	**$1,493,171**	**$617,580**	**$3,329,442**
Revenue Coverage (B ÷ A)	**1.07×**	**1.11×**	**1.11×**	**1.10×**

Because each model has its own CRI-8G rate, the coverage calculation reflects the market value of each GPU generation independently. A mixed fleet's revenue coverage is not distorted by averaging across generations with different price points. Per-model Effective Utilization on the compliance certificate lets the lender see which generation is underperforming without a separate covenant trigger.

On the threshold. 1.05× is tight by design. A facility with a larger contract premium at closing may warrant a higher threshold (1.15–1.25×); a facility with shorter contract terms may warrant a lower one. CCIR's published rate history supports backtesting — CCIR does not recommend specific levels.

© 2026 Compute Credit Index Research LLC · research@ccir.io · ccir.io

5. §7.02 — Collateral Coverage / LTV

Marks the pledged GPU fleet to the current on-demand market using per-model CRI-8G rates — not book depreciation, not contracted revenue. A multi-model fleet requires per-model marks because H100, B200, and H200 nodes trade at materially different levels. The formula: (GPU Count × CRI-8G Rate × 8,760 hrs × Utilization Assumption) ÷ Capitalization Rate.

6.1 Illustrative Covenant Language

SECTION 7.02 — COLLATERAL COVERAGE RATIO — Financial Covenant

Borrower shall not permit LTV (Outstanding Credit Exposure ÷ GPU Collateral Value) to exceed 80% as of any Calculation Date. [LTV cap is a credit judgment set at underwriting.]

"GPU Collateral Value" means, as of any Calculation Date, the sum for each Eligible GPU Model of: (Pledged GPUs of such model) × (CRI 8-GPU Node Rate for such model) × 8,760 × Utilization Assumption ÷ GPU Capitalization Rate.

"Utilization Assumption" means seventy-two percent (72%) for GPU hours deployed in training workloads; sixty-five percent (65%) for GPU hours deployed in inference workloads. [72%/65% are illustrative — credit judgments set at underwriting.]

"GPU Capitalization Rate" means twenty-eight percent (28%) per annum. [28% is illustrative — credit judgment set at underwriting.]

"CRI 8-GPU Node Rate" means, for any GPU Model, the applicable rate within the CRI-8G Benchmark Series (on-demand asking rate, noninterruptible, 7-day trailing median, $/GPU/hr) as published daily by Compute Credit Index Research at computecreditindex.com or any successor URL designated by the Administrator.

If a CRI 8-GPU Node Rate is not published for any model on a Calculation Date, the most recently published rate within the prior 5 Business Days shall be used. If no publication is available within such period, the fallback provisions set forth in the credit agreement shall apply.

6.2 Worked Example — Per-Model Collateral Valuation

GPU Model	GPUs	CRI-8G Rate	Annual Rev/GPU	Util Rev/GPU	Coll Value/GPU	Fleet Coll Value
NVIDIA H100 SXM	480	$3.25/hr	$28,470	$20,498	$73,209	$35.1M
NVIDIA B200 SXM	320	$5.75/hr	$50,370	$36,266	$129,523	$41.4M
NVIDIA H200 SXM	200	$3.80/hr	$33,288	$23,967	$85,598	$17.1M
Total	**1000**					**$93.7M**

GPU Collateral Value (A)	$93.7M
Advance Rate	65%
Borrowing Base (A × Advance Rate) (B)	**$60.9M**
Outstanding Credit Exposure (C)	$40.0M
Borrowing Base Surplus / (Deficiency) (B − C)	**$20.9M**
LTV Ratio (C ÷ A)	42.7%

CRI-8G rates are the only variable inputs that change each Calculation Date. All other parameters are set at closing. Both parties can independently verify the Collateral Value and Borrowing Base from the CCIR data repository without discretionary inputs.

5.3 Rate Cap Scenario Analysis

	Base Case	–25% Stress	–35% Stress	–50% Stress
CRI-8G Rates	As published	75% of base	65% of base	50% of base
GPU Collateral Value	$93.7M	$70.3M	$60.9M	$46.9M
Borrowing Base (65% adv)	$60.9M	$45.7M	$39.6M	$30.5M
Outstanding ($40.0M)	$40.0M	$40.0M	$40.0M	$40.0M
Cushion / (Deficiency)	**+$20.9M**	**+$5.7M**	**$-0.4M**	**$-9.5M**
LTV Ratio	42.7%	56.9%	65.7%	85.4%
Status	✓	✓	⚠ **Near-breach**	⚠ **Breach**

The –35% scenario produces a near-breach — Borrowing Base approximately equal to Outstanding Credit Exposure. The –50% scenario produces a clear deficiency and LTV above 80%. Rate compression at these levels has already been observed in the GPU compute market.

On the Capitalization Rate. The most negotiated variable at underwriting. A lower cap rate produces higher Collateral Value and more favorable LTV; a higher cap rate is more conservative. As the GPU rental market matures and transaction comparables accumulate, market consensus cap rates will emerge. CCIR's published rate history supports calibration — CCIR does not recommend specific levels.

6. §7.03 — Contract Renewal Risk

Monitors the spread between the borrower's Base Contracted Rate and CRI-8G per GPU model across a rolling six-period forward window. Two distinct risks: convergence risk (CRI-8G rising toward contracted rates, eroding renewal leverage) and reset cliff risk (CRI-8G well below contracted rates, with material contract volume expiring into a materially lower market). Because each GPU model has its own CRI-8G rate and its own contracted rate, the Contract Premium Ratio is computed per model.

6.1 Illustrative Covenant Language

SECTION 7.03 — CONTRACT RENEWAL RISK — Surveillance Covenant

"Base Contracted Rate" means, for each Eligible GPU Model, the gross contracted rate per GPU per hour less the fixed-dollar deductions set forth in the Premium Schedule attached as Schedule [X], representing agreed deductions for cluster, SLA, networking, storage, and other premium components agreed at closing. [Premium Schedule deductions are credit judgments agreed at closing.]

"Contract Premium Ratio" means, for each Eligible GPU Model as of any Calculation Date, the Base Contracted Rate for such model divided by the CRI 8-GPU Node Rate for such model. "Forward Renewal Exposure" means, as of any Calculation Date, the percentage of total contracted GPU-hours under agreements whose primary term expires within the following six (6) Calculation Periods. Auto-renewals count as unexpired only if the renewal rate is contractually fixed at closing.

A "Convergence Notice Event" shall occur if the Contract Premium Ratio for any Eligible GPU Model falls below 1.10 as of any Calculation Date, indicating that the Base Contracted Rate for such model is approaching the current on-demand market rate and renewal leverage is eroding. [1.10× is illustrative.]

A "Reset Cliff Notice Event" shall occur if (i) the Contract Premium Ratio for any Eligible GPU Model exceeds 1.50 as of any Calculation Date, and (ii) Forward Renewal Exposure exceeds thirty percent (30%) of total contracted GPU-hours, indicating that a material volume of contracts is subject to near-term re-pricing into a materially lower on-demand market rate. [1.50× and 30% are illustrative.]

Upon occurrence of either event, Borrower shall, within ten (10) Business Days, deliver written notice to the Administrative Agent including: (i) a schedule of contracts expiring within the following six (6) Calculation Periods by GPU Model, including customer, Base Contracted Rate, gross contracted rate, and remaining term; (ii) Borrower's assessment of renewal prospects and current on-demand market conditions; and (iii) projected GPU Rental Revenue for the following two (2) Calculation Periods under both a renewal scenario and a re-pricing scenario at the then-current CRI 8-GPU Node Rates.

A Convergence Notice Event and a Reset Cliff Notice Event are surveillance mechanisms only. Neither is itself an Event of Default.

If a CRI 8-GPU Node Rate is not published for any model on a Calculation Date, the most recently published rate within the prior 5 Business Days shall be used. If no publication is available within such period, the fallback provisions set forth in the credit agreement shall apply.

6.2 Worked Example — Per-Model Contract Premium Ratio

	H100 SXM	B200 SXM	H200 SXM
Gross Contracted Rate	$4.50/hr	$8.00/hr	$5.40/hr
Premium Schedule Deductions	($0.80)	($1.20)	($0.90)
Base Contracted Rate (a)	$3.70/hr	$6.80/hr	$4.50/hr
CRI-8G Rate (b)	$3.25/hr	$5.75/hr	$3.80/hr
Contract Premium Ratio (a ÷ b)	**1.14×**	**1.18×**	**1.18×**

On the Premium Schedule. The most important drafting element. Deductions that are too aggressive understate the CPR and create false comfort; deductions that are too narrow overstate it and produce spurious notice events. A borrower with a gross contracted rate of $8.00/hr for B200 nodes against CRI-B200-8G at $5.75/hr shows a gross ratio of 1.39×. If the Premium Schedule attributes $1.20/hr to cluster, SLA, and networking, the Base Contracted Rate is $6.80/hr and the CPR is 1.18× — meaningfully closer to the notice trigger than the gross ratio suggests.

On per-model monitoring. A borrower may show a healthy fleet-weighted CPR while a single model's CPR is approaching the convergence threshold. The H100 CPR at 1.14× is closest to the 1.10× notice trigger — a moderate CRI-H100-8G increase would fire a Convergence Notice for H100 while B200 and H200 remain comfortable. Per-model visibility is essential.

7. CCIR Rate Reference Support

Structured finance counsel and credit analysts with questions about CRI rate methodology, index definitions, fallback provisions, or how CRI-8G rates may be cited in credit agreements may contact CCIR at research@ccir.io. CCIR will respond to written inquiries within 10 business days.

CCIR does not provide legal advice, does not review or approve credit agreement language, does not recommend covenant thresholds or structural terms, and does not advise on the regulatory treatment of CRI rate references in any jurisdiction. All parameters, thresholds, and formula inputs in credit agreements referencing CRI rates are determined solely by counsel and lenders.

Disclaimer: This document is published by Compute Credit Index Research LLC for informational purposes only. All borrower details, facility structures, rates, threshold levels, multiples, advance rates, and structural terms shown are hypothetical, illustrative, and entirely non-prescriptive. Nothing in this document constitutes a recommendation regarding how any credit agreement should be structured, what thresholds should be set, or what structural terms should be used. This document does not constitute legal advice and does not represent a commitment to provide financing or any other financial service. Transaction parties should seek independent legal counsel when structuring credit agreements. CCIR is a reference rate provider. CCIR holds no financial interest in the GPU compute market it measures.
